### Abstract

This article examines the role of digital transit documents, single window systems, and logistics parks in the development of international economic cooperation and modern logistics infrastructure. In the context of globalization and digital transformation, the implementation of electronic documentation and integrated digital platforms has become an important factor for improving the efficiency of international transport corridors and trade operations. The study analyzes international experience in the application of digital transit documentation and the single window mechanism, emphasizing their contribution to the simplification of customs procedures, reduction of administrative barriers, and acceleration of cross-border trade processes. Particular attention is paid to the creation and development of logistics parks as integrated infrastructure complexes that combine transport, warehousing, customs, and logistics services within a unified system. The research also highlights the strategic role of regional cooperation in the formation of modern logistics networks. Special consideration is given to Azerbaijan’s geostrategic position and its growing importance as a transport and logistics hub in Eurasia. The article concludes that the integration of digital technologies, coordinated policy measures, and international collaboration are essential for strengthening global supply chains and ensuring sustainable development of transport and logistics systems.

Keywords: digital transit documents, single window system, logistics parks, international cooperation, digitalization, transport corridors, logistics infrastructure

### Introduction

In the modern system of international economic relations, transport and logistics infrastructure plays a key role in shaping the competitiveness of states. Globalization, digital transformation, and the rapid growth of international trade have significantly increased the importance of efficient transit systems. Countries that successfully modernize their logistics infrastructure and integrate digital technologies into transport management gain considerable advantages in global markets.

In recent years, the concept of digitalization has become a central element in the modernization of transport and logistics processes. The introduction of digital transit documents, the development of single window systems, and the establishment of logistics parks represent important tools for improving the efficiency and transparency of international transport operations.

Digital solutions enable the simplification of document circulation, reduction of bureaucratic barriers, and acceleration of cross-border trade procedures. These mechanisms also strengthen cooperation among states by creating unified platforms for information exchange and regulatory

coordination. Consequently, digital transformation in the logistics sector has become an important factor in the development of sustainable international economic cooperation.

The aim of this article is to analyze the significance of digital transit documentation, single window systems, and logistics parks in strengthening international cooperation and improving the efficiency of global transport corridors.

### **Digital Transit Documents and Their Significance**

Digital transit documents represent electronic versions of traditional transport and trade documentation used in international freight transportation. Their implementation allows for the automation of document exchange between customs authorities, logistics operators, and transport companies.

The use of electronic documents significantly reduces the time required for customs clearance and border crossing procedures. In addition, digital documentation contributes to the transparency and traceability of cargo movements, which enhances trust among international partners and reduces the risks of administrative errors.

International practice demonstrates that countries implementing electronic documentation systems have achieved significant improvements in logistics performance. Digital transit documents facilitate real-time data exchange and enable more efficient management of transport routes and supply chains.

Another important advantage of digital documentation is the reduction of paper-based procedures. This contributes not only to cost reduction but also to environmental sustainability. Therefore, the digitalization of transit documentation is considered a key element of modern logistics management and international trade facilitation.

### **The Role of Single Window Systems**

The single window system is an integrated digital platform that allows traders and logistics companies to submit all required documentation through a single interface. Instead of interacting separately with multiple government agencies, users can complete administrative procedures through one unified system.

This mechanism simplifies trade procedures, reduces administrative burdens, and increases the efficiency of regulatory processes. Single window systems also facilitate faster information exchange between government institutions responsible for customs control, transport regulation, and border management.

Many countries have successfully implemented such systems as part of their trade facilitation strategies. The integration of digital technologies into public administration has significantly improved the efficiency of customs services and reduced delays in cross-border trade operations.

In Azerbaijan, important reforms have been implemented in recent years to develop the single window mechanism. These reforms have contributed to the modernization of customs administration and the improvement of the national logistics environment. The continued development of this system is expected to further enhance the country's role in regional trade networks.

### **Development of Logistics Parks and Regional Cooperation**

Logistics parks are specialized infrastructure complexes that integrate transport terminals, warehouses, customs services, and logistics companies within a single territory. Such facilities play a crucial role in improving the efficiency of supply chains and facilitating international trade.

The establishment of logistics parks allows for the optimization of transport flows and the reduction of logistics costs. By concentrating different logistics services in one location, these parks create favorable conditions for the development of multimodal transportation and efficient cargo handling.

Regional cooperation is an essential factor in the successful development of logistics parks. International transport corridors require coordinated policies and infrastructure investments among participating countries. Cooperation between governments, private companies, and international organizations helps ensure the effective functioning of logistics networks.

Azerbaijan occupies a strategically important position between Europe and Asia, which creates significant opportunities for the development of logistics infrastructure. Projects such as the Baku International Sea Trade Port and the Alat Free Economic Zone are strengthening the country's role as a major logistics hub in the Eurasian region.

### **Conclusion**

The analysis demonstrates that digital transit documents, single window systems, and logistics parks are essential components of modern logistics infrastructure. Their development significantly contributes to the improvement of international trade efficiency and the strengthening of economic cooperation between countries.

Digital technologies simplify administrative procedures, increase transparency in logistics operations, and reduce transaction costs. At the same time, logistics parks provide the necessary physical infrastructure for the effective functioning of transport corridors and supply chains.

For countries seeking to strengthen their position in global transport networks, the integration of digital technologies and the development of modern logistics infrastructure represent strategic priorities. Azerbaijan's geographical location and ongoing infrastructure projects provide favorable conditions for the expansion of its role as a regional transport and logistics hub.

Further development in this field requires continued international cooperation, investment in digital infrastructure, and coordinated policy measures aimed at facilitating trade and transport operations.
